

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (currently amended): A guide insertion device (8; 108) suitable for the insertion of a guide into a check valve made of a surgical material comprising a body (10; 110) delimiting a duct (12; 112) for guiding the guide, the duct being open at its two ends, the body having, from a first end of the duct, a slim cannula (14; 114) extending along the axis of the duct and suitable for being engaged through the check valve, characterized in that the body (10; 110) has a slot (24; 124) extending longitudinally along the length of the duct (12; 112) from one end to the other of this duct and opening into the duct (12; 112) along its whole length, in that the diameter of the duct (12; 112) along the length of the body (10; 110) increases progressively from the first end to the second end, ~~and~~ in that the outer surface of the cannula (14; 114) is generally frustoconical and flares progressively from said first end of the duct, and in that the minimal diameter of the duct (112) lies between 1.5 mm and 2.5 mm.

2. (original): The guide insertion device as claimed in claim 1, characterized in that the body (10; 110) is formed of a single monobloc piece.

3. (previously presented): The guide insertion device as claimed in claim 1, characterized in that the cannula (14; 114) extends over a length greater than 50% of the total length of the duct (12; 112).

4. (previously presented): The guide insertion device as claimed in Claim 1, characterized in that the body (10; 110) comprises around the second end of the duct (12; 112) a divergent frustoconical wall (20; 120) axially extending said cannula (14; 114).

5. (original): The guide insertion device as claimed in claim 4, characterized in that said frustoconical wall (20; 120) internally delimits a centering cone (22; 122) whose maximal diameter lies between 1.5 and five times its minimal diameter.

6. (previously presented): The guide insertion device as claimed in claim 4, characterized in that said frustoconical wall (20; 120) internally delimits a centering cone (22; 122) whose maximal diameter lies between 3 and 8 times the minimal diameter of the duct (12; 112).

7. (canceled).

8. (previously presented): The guide insertion device as claimed in claim 1, characterized in that the width of the slot (124) lies between 0.08 and 0.15 mm.

9. (previously presented): The guide insertion device as claimed in claim 1, characterized in that the ratio of the minimal diameter of the duct (112) to the width of the slot (124) lies between 12 and 22.

10. (canceled).

11. (previously presented): The guide insertion device as claimed in claim 1, characterized in that the width of the slot (24) lies between 0.15 mm and 0.50 mm.

12. (previously presented): The guide insertion device as claimed in claim 1, characterized in that the ratio of the minimal diameter of the duct (12) to the width of the slot (24) lies between 5 and 9.

13. (previously presented): The guide insertion device as claimed in claim 1, characterized in that the length of the duct (12; 112) lies between 7 cm and 13 cm.

14. (previously presented): The guide insertion device as claimed in claim 1, characterized in that the body (10; 110) has two internal bevels (28) made along the whole length

of the slot (24; 124) between each of the opposite side walls of the slot (24; 124) and the surface of the duct (12; 112).
